

# Deploy a React Application With Netlify

## Deploying

You can use Netlify to deploy and host your static sites.

## Linking a Repo

You can link a GitHub repository that contains the code to your static site to your Netlify account and have the site deployed and hosted.

## Continuous Deployment

With Continuous Deployment, Netlify automatically updates your site once you've updated the code in your GitHub repository.

## Site Logs

To check if your site is running, look over the logs that Netlify provides for each of your static sites.
